# JAY-DEE MATERNALS

Welcome to our 8<sup>th</sup> annual Maternal Composite sale. The Jay-Dee Maternals breed blend delivers a hardy, good doing sheep with good carcass, early growth, high fertility and good mothering traits. We supply high performance balanced genetics for you to breed on from the ewe portion of your flock, producing **more** and **better** lambs.

Ram production has been a major part of our business since 1988. We maintain a high level of health status for both your and our protection with Brucellosis accreditation and Ovine Johne's Disease testing to MN3 status as well as Gudair vaccination for on-going protection on your property.

Our cross-breeding experimentations started in 1994 and Jay-Dee Maternals are trialled and used in our own commercial flock and feedlot. Both stud and commercial breeding ewes are all mated as lambs to test their fecundity and fertility.

Lambplan has introduced a new Maternal Carcass Production Plus index for maternal sheep and this replaces the Maternal \$ index used previously. We have listed both this year for your information.

Although we have been recording and scanning our composite flock for 20 years we have only comparatively recently joined LAMBPLAN. We also regularly introduce sires from other flocks untested by Lambplan to bring in new genetics. It takes some time for enough data to be collected on these sires' progeny to reflect their true worth in Lambplan breeding values. The progeny of these rams will in the meantime have lower indexes. This particularly applies to the Y(yellow) tag line in the catalogue.

All the rams are run as one mob so visual size differences may be due to inherited genes or rearing type & date of birth. The rams offered are all spring 2015 drop. The index gives a general indication of genetic worth but the individual breeding values indicate the genetic potential in areas where you may wish to improve your flock. If anyone would like assistance with ram selections or help with the direction of their breeding program please don't hesitate to ask John or Josh.

The rams are catalogued in groups selected for their common sire line. They will be offered in pairs with the right to buy one or both rams.

We look forward to you joining us for lunch before the sale.

John, Josh, Judy & Jackson Dowdy

# CATALOGUE INFORMATION AND AUSTRALIAN SHEEP BREEDING VALUES (ASBVS) EXPLAINED

**LOT:** The order of sale. The rams are grouped together by their sire's breeding

**ID:** Ear tag identification number. The colour of the tag denotes the sire line.

**BREED COMPOSITION %:** There is some variation in breed % among the rams offered to meet different clients' needs. The % has been rounded which may result in a slight variance to the total %.

EAST FRIESIAN/ FINNSHEEP/TEXEL/BORDER LEICESTER/ 'KELSO (NZ maternal composite breed) /COOPWORTH/DORSET/WHITE SUFFOLK breeds are included.

**SIRE ID:** Sire of each ram. You may wish to select rams bred from the same sire for a more even drop of lambs.

**DOB:** Date of birth in 2015      **BT:** Birth type shows the number of lambs born to the dam. **RT :** refers to the number actually reared.

**BWT:** (Birth Weight) Our lambs are weighed and tagged at birth. Lambs too small have low survivability, too large cause dystocia & lambing issues.

**MWWT:** (Maternal Weaning Weight in kg) This estimates the dam's milk production and mothering ability at 100 days (weaning).

**WWT:** (Weaning Weight in kg) Estimates the genetic difference in growth at 100 days. The rams were all weighed at weaning.

**PWWT:** (Post Weaning Weight in kg) Estimates the genetic difference in growth at 225 days. They were all weighed at post wean age.

**PFAT:** (Post Weaning Fat depth in mm) Estimates the genetic difference in GR fat depth at 45 kg live weight. All the rams were scanned at post weaning.

**PEMD:** (Post Weaning Eye Muscle Depth in mm) Estimates the genetic difference in eye muscle at the C site at 45 kg. A positive ASBV means a genetically thicker-muscled animal.

**YGFW:** (Yearling greasy fleece weight) generated from the different weights when fleeces were weighed at shearing in August and correlated fleece information.

**PSC:** (Post Weaning Scrotal Circumference) Measured when scanned at post weaning. Estimates the genetic difference between rams at 225 days. It is expected that rams with higher scrotal circumference at an early age will, on average, sire daughters that are more fertile at a younger age.

**NLW:** (Number of Lambs Weaned expressed as %). An indication of fertility. Estimates the genetic difference between animals for the number of lambs likely to be weaned each lambing. (Generated from pedigree/progeny records.)

**INDEX:** The index shown is the **Maternal Carcase Production Plus** as this has replaced the Maternal \$ index for this breed. .

**acc:** accuracies for each trait. Despite intensive and accurate data collection, young animals will only achieve high degrees of accuracy after they have had progeny tested and recorded in Lambplan.

# HEALTH STATUS

**Drenching :** The rams have been drenched recently, however it is recommended that any stock introduced to your property are drenched upon arrival.

**Vaccinations :** All rams are fully vaccinated with 6 in 1, Eryvac and Scabby Mouth vaccines.

**Ovine Johne's Disease : MN3 V status / ABC 10 points.** Gudair vaccination commenced in 2006.

**Ovine Brucellosis :** accredited no. 373

Although the property is free of lice, the rams were dipped after shearing in August as a precaution.

## MANAGEMENT OF YOUR NEW RAMS

The rams presented have been grown out on spring pasture to be in prime working condition. Each ram has recently been drenched and vaccinated. Their future management, especially in the next year will influence the rams productive life in your breeding program.

We wish you every success with your purchase and suggest that you:

- Place new rams in a secure paddock away from older rams and unjoined females until mating. If absolutely necessary to introduce new rams to other rams before mating, try to lessen the risk of injury by confining the group in a small pen, eg. catching pen. Leave for 12-24 hours until more settled before releasing.
- Be aware that Ovine Brucellosis is the most common cause of ram infertility in Australia and can be transmitted to your rams from any sexually active males as well as recently joined females (for up to six weeks after mating).
- Injuries can lead to infection and require prompt treatment with antibiotics (especially lameness).
- In the interval before mating feed your rams well, remembering semen is manufactured six weeks prior to use. If you are able to supplement your rams' diet with lupins it will improve semen quality.
- Your rams will perform better if they have a short fleece during the mating season.
- Don't overwork rams in their first season. Preferably put them with older or mixed age ewes.
- After use treat them well, they are your investment for future years. Give regular drenches, 6 in 1 vaccinations, adequate nutrition and regular physical examinations to help ensure a long productive life.

We guarantee that our rams will successfully complete their first breeding season so if you feel a ram has failed to do this please contact us to discuss the matter as soon as possible. (*conditions apply*)

If you would like any further advice, please feel free to contact us at any time.

Thankyou for your support  
John, Josh, Judy & Jackson
